Autopsy Report

Based on the available case history and autopsy findings, it is my opinion that Angelica Martin Martinez, a 48-year-old woman, died as result of Diabetes mellitus and its complications. Although her hospital course was complicated and the admitting diagnosis unclear, given the combination of autopsy findings, lack of other natural disease, noncontributory toxicology, and consistently elevated glucose levels, diabetic ketoacidosis is

the most likely diagnosis. The hypoglycemia diagnosed initially was likely an artifact of cardiopulmonary arrest. While no seizure focus was identified at autopsy, epilepsy cannot be excluded as having contributed to her death.

MANNER OF DEATH: Natural
